## Assignment 25

## Announcements

**Today: Improper Integrals  
Applications in Probability and Statistics**

Wednesday: Line Integrals

Friday: Weighted Curves and Surfaces of Revolution

**Exam 3:  
Monday, April 28**

## Improper Integrals

Let  $\{B_\delta\}$  be a family of bounded sets  $B_\delta$  that expands to cover all of the set  $B$ . We say  $\int_B f(\mathbf{x}) dV$  is defined as an **improper integral** if the limit

$$\int_B f(\mathbf{x}) dV = \lim_{B_\delta} \int_{B_\delta} f(\mathbf{x}) dV \text{ is finite and independent of the family } \{B_\delta\}$$

used to define it. If the limit exists (as a finite number), we say that the improper integral **converges** to that value. If the limit fails to exist, we say the improper integral **diverges**.

An Important Example:  
**Exponential Probability Density Function**

$$\begin{aligned}\int_0^{\infty} e^{-x} dx &= \lim_{b \rightarrow \infty} \int_0^b e^{-x} dx = \lim_{b \rightarrow \infty} \left[ -e^{-x} \Big|_{x=0}^b \right] \\ &= \lim_{b \rightarrow \infty} \left[ -e^{-b} - (-e^0) \right] = \lim_{b \rightarrow \infty} \left[ 1 - \frac{1}{e^b} \right] = 1\end{aligned}$$

## Exponential Probability Density Function

$$\text{Probability(Light Bulb Burns Out in } \leq x \text{ months)} = \int_0^x e^{-t} dt = 1 - e^{-x}$$

$x$	$\int_0^x e^{-t} dt$	Prob(Bulb Lasts More than $x$ months)
1	.632	.368
2	.865	.135
3	.950	.050
4	.982	.018

Suppose You Buy 2 Light Bulbs  
**What Is The Probability They Will Provide At Least 3  
Months of Service?**

$$\text{Prob}(x + y > 3) = 1 - \text{Prob}(x + y \leq 3)$$

$$= 1 - \int_{x=0}^3 \int_{y=0}^{3-x} e^{-x} e^{-y} dy dx$$

Evaluate  $1 - \int_{x=0}^3 \int_{y=0}^{3-x} e^{-x} e^{-y} dy dx$

$$= 1 - \int_0^3 e^{-x} \left[ -e^{-y} \Big|_{y=0}^{3-x} \right] dx$$

$$= 1 - \int_0^3 e^{-x} [-e^{3-x} + 1] dx$$

$$= 1 - \int_0^3 (e^{-x} - e^{-3}) dx$$

$$= 1 - [-e^{-x} - e^{-3}x]_{x=0}^3$$

$$= 1 - [-e^{-3} - 3e^{-3} + 1 + 0] = 1 - \left[ 1 - \frac{4}{e^3} \right] = \frac{4}{e^3} \approx .199$$

## Probability Density Function

A real-valued function  $p$  such that  $p(\vec{x}) \geq 0$  for all  $\vec{x}$  and  $\int_S p = 1$  where  $S$  is the set of all possibilities.

Example 1 Uniform Density:  $p(x) = 1$  on  $[0,1]$

$$\int_S p = \int_0^1 1 = x \Big|_0^1 = 1$$

Example 2:  $p(x) = 2 - 2x$  on  $[0,1]$

More likely to choose small numbers than larger numbers

Problem: Find the probability of picking a number less than  $1/2$ .

$$\int_0^{1/2} (2 - 2x) dx = (2x - x^2) \Big|_0^{1/2} = \left(1 - \frac{1}{4}\right) - (0 - 0) = \frac{3}{4}$$

A probability density function on a set  $S$  in  $\mathbb{R}^n$  is a continuous non-negative real-valued function  $p : S \rightarrow \mathbb{R}^1$  such that

$$\int_S p dV = 1$$

If an experiment is performed where  $S$  is the set of all possible outcomes, then the probability that the outcome lies in a particular subset  $T$  is  $\int_T p(\vec{x}) dV$ .

Example: **The Bell Curve:** The most important curve in statistics

Start with  $y = e^{-\frac{x^2}{2}}$

Then  $y' = -xe^{-\frac{x^2}{2}}$  and  $y'' = (x^2 - 1)e^{-\frac{x^2}{2}}$

Point of inflection at  $(1, \frac{1}{\sqrt{e}}) = (1, .606)$

Need to find  $A = \int_{-\infty}^{\infty} e^{-\frac{x^2}{2}} dx$

Impossible to find antiderivative of  $e^{-\frac{x^2}{2}}$

Need to find  $A = \int_{-\infty}^{\infty} e^{-\frac{x^2}{2}} dx$

$$\begin{aligned} A^2 &= \left( \int_{-\infty}^{\infty} e^{-\frac{x^2}{2}} dx \right) \left( \int_{-\infty}^{\infty} e^{-\frac{x^2}{2}} dx \right) \\ &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-\frac{x^2+y^2}{2}} dy dx = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-\frac{x^2+y^2}{2}} dy dx \end{aligned}$$

**Switch To Polar Coordinates:**  $A^2 = \int_{r=0}^{\infty} \int_{\theta=0}^{2\pi} e^{-\frac{r^2}{2}} r d\theta dr$

$$A^2 = 2\pi \int_{r=0}^{\infty} r e^{-\frac{r^2}{2}} dr = 2\pi \lim_{b \rightarrow \infty} \int_{r=0}^b r e^{-\frac{r^2}{2}} dr$$

$$= 2\pi \lim_{b \rightarrow \infty} \left[ -e^{-\frac{r^2}{2}} \right]_0^b = 2\pi \lim_{b \rightarrow \infty} \left[ -\frac{1}{e^{b^2/2}} + \frac{1}{e^0} \right] = 2\pi \times 1 = 2\pi$$

Thus  $A^2 = 2\pi$  so  $A = \sqrt{2\pi}$

$$\int_{-\infty}^{\infty} e^{-\frac{x^2}{2}} dx = \sqrt{2\pi}$$

To get a probability density, let  $p(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$   
This density is called the **Standard Normal Density**

Example: Suppose two numbers  $b$  and  $c$  are chosen at random between 0 and 1.

What is the probability that the quadratic equation  $x^2 + bx + c = 0$  has a real root?

Solution: Choosing  $b$  and  $c$  is equivalent to choosing a point  $(b, c)$  from the unit square  $S$  with  $p(\vec{x}) = 1$  ( **Uniform Density** )

Then  $\int_S p(\vec{x}) = \int_S 1 = \text{area}(S) = 1$ .

Now  $x^2 + bx + c = 0$  has solution  $x = \frac{-b \pm \sqrt{b^2 - 4c}}{2}$

For real root, need  $b^2 - 4c \geq 0$  or  $c \leq \frac{b^2}{4}$

Let  $T = \{(b, c) : c \leq \frac{b^2}{4}\}$

$$\int_T p(\vec{x}) = \int_{x=0}^1 \int_{y=0}^{x^2/4} 1 \, dy \, dx = \int_{x=0}^1 \frac{x^2}{4} \, dx = \left. \frac{x^3}{12} \right|_0^1 = \frac{1}{12}$$

## General Exponential Probability Distribution

$$p(x) = \lambda e^{-\lambda x} \text{ for } x \geq 0, \lambda > 0$$

Easy to Show:

$$\int_0^{\infty} \lambda e^{-\lambda x} dx = 1 \text{ so it is a probability distribution}$$

$$\text{Mean } \int_0^{\infty} \lambda x e^{-\lambda x} dx = \frac{1}{\lambda}$$

$$\text{Prob}(\text{Bulb life} \geq 3) = 1 - \int_3^{\infty} \lambda e^{-\lambda x} dx = 1 + e^{-\lambda x} \Big|_3^{\infty} = 1 - e^{-3\lambda}$$

$$\text{Prob}(2 \text{ lights have life} \geq 3) = e^{-3\lambda}(1 + 3\lambda)$$

$$\text{More than } b \text{ hours: } e^{-3b\lambda}(1 + b\lambda)$$
