

Vector Fields

A vector field is a function

$$F: \mathbb{R}^n \rightarrow \mathbb{R}^n$$

same

Idea: at every pt in \mathbb{R}^n , place an n -vector.

Ex $F(x, y) = (y, x)$

Example

$$F(x, y) = (y, x)$$

Important Example

Sps $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is a scalar function.

The gradient of f ,

$$\nabla f(\vec{x}) = \left(\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_n} \right)$$

is a vector field.

Ex $f(x, y) = xy$

$$\nabla f(x, y) = (y, x)$$

← previous example.

vector fields

Note: not every vector field is the gradient of some scalar function f .

← special property.

If $\vec{F} = \nabla f$ for some f , \vec{F} is called conservative and f is called a potential function of \vec{F} .
