Exam 2 on Wednesday, April 16

Theorem from Last Time:

Suppose λ, μ, ρ are distinct eigenvalues of the $n \times n$ matrix A with corresponding eigenvectors $\mathbf{v}, \mathbf{w}, \mathbf{u}$, respectively; that is

$$A\mathbf{v} = \lambda\mathbf{v}$$

$$A\mathbf{w} = \mu\mathbf{w}$$

$$A\mathbf{u} = \rho\mathbf{u}.$$

Then the set $\{\mathbf{v}, \mathbf{w}, \mathbf{u}\}$ is linearly independent.

A Major Generalization:

Let $\lambda_1, \lambda_2, \dots, \lambda_m$ be m distinct eigenvalues of a square matrix A with corresponding eigenvectors $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_m$, respectively; that is,

$$A\mathbf{v}_i = \lambda_i\mathbf{v}_i \text{ for } i = 1, 2, 3, \dots, m.$$

Then the set $\{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_m\}$ is linearly independent.

The four steps of math induction:

1 Show $P(1)$ is true

Let $n = 1$ and work it out.

2 Assume $P(k)$ is true

Stick a k in for all the n 's
and say it's true.

3 Show $P(k) \rightarrow P(k+1)$

* In math, the arrow \rightarrow means "implies" or "leads to."

USE $P(k)$ to show that
 $P(k+1)$ is true.

Very important!

4 End the proof

Write "Thus, $P(n)$ is true." ■

This is the modern way to end a proof.

Theorem: Let $\lambda_1, \lambda_2, \dots, \lambda_m$ be m distinct eigenvalues of a square matrix A with corresponding eigenvectors $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_m$, respectively; that is, $A\mathbf{v}_i = \lambda_i\mathbf{v}_i$ for $i = 1, 2, 3, \dots, m$. Then the set $\{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_m\}$ is linearly independent.

Consequently, the functions $e^{\lambda_1 t}\mathbf{v}_1, e^{\lambda_2 t}\mathbf{v}_2, \dots, e^{\lambda_m t}\mathbf{v}_m$ form a linearly independent set of solutions to the system $\mathbf{x}' = A\mathbf{x}$.

Here is a different generalization:

Suppose λ and μ are distinct eigenvalues of a square matrix A .

The eigenvalue λ has associated with it a set of 3 linearly independent eigenvectors $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3$ while the eigenvalue μ has an associated set of 2 eigenvectors $\mathbf{w}_1, \mathbf{w}_2$.

Then the set $\{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3, \mathbf{w}_1, \mathbf{w}_2\}$ is linearly independent.

Theorem: Suppose λ and μ are distinct eigenvalues of a square matrix A . The eigenvalue λ has associated with it a set of 3 linearly independent eigenvectors $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3$ while the eigenvalue μ has an associated set of 2 eigenvectors $\mathbf{w}_1, \mathbf{w}_2$.

Then the set $\{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3, \mathbf{w}_1, \mathbf{w}_2\}$ is linearly independent.

Proof: Suppose C_1, C_2, C_3, C_4, C_5 are constants such that

$$(*) C_1 \mathbf{v}_1 + C_2 \mathbf{v}_2 + C_3 \mathbf{v}_3 + C_4 \mathbf{w}_1 + C_5 \mathbf{w}_2 = \mathbf{0}$$

Multiply $(*)$ by A to obtain

$$C_1 A \mathbf{v}_1 + C_2 A \mathbf{v}_2 + C_3 A \mathbf{v}_3 + C_4 A \mathbf{w}_1 + C_5 A \mathbf{w}_2 = A \mathbf{0} \text{ or}$$

$$(**) C_1 \lambda \mathbf{v}_1 + C_2 \lambda \mathbf{v}_2 + C_3 \lambda \mathbf{v}_3 + C_4 \mu \mathbf{w}_1 + C_5 \mu \mathbf{w}_2 = \mathbf{0}$$

Also multiply $(*)$ by λ to obtain:

$$(***) C_1 \lambda \mathbf{v}_1 + C_2 \lambda \mathbf{v}_2 + C_3 \lambda \mathbf{v}_3 + C_4 \lambda \mathbf{w}_1 + C_5 \lambda \mathbf{w}_2 = \mathbf{0}$$

Subtract equation $(***)$ from equation $(**)$:

$$C_4(\mu - \lambda) \mathbf{w}_1 + C_5(\mu - \lambda) \mathbf{w}_2 = \mathbf{0}$$

But $\{\mathbf{w}_1, \mathbf{w}_2\}$ is a linearly independent set so $C_4 = 0, C_5 = 0$ since $\lambda \neq \mu$.

Substituting back into $(*)$, we have $(*) C_1 \mathbf{v}_1 + C_2 \mathbf{v}_2 + C_3 \mathbf{v}_3 = \mathbf{0}$

Linear Independence of $\{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3\}$ now implies $C_1 = C_2 = C_3 = 0$ as well.

Political Movement Model

$$L' = -.2L + .25M + .1R = -\frac{1}{5}L + \frac{1}{4}M + \frac{1}{10}R$$

$$M' = .15L - .6M + .2R = \frac{3}{20}L - \frac{3}{5}M + \frac{1}{5}R$$

$$R' = .05L + .35M - .3R = \frac{1}{20}L + \frac{7}{20}M - \frac{3}{10}R$$

$$L' = -\frac{1}{5}L + \frac{1}{4}M + \frac{1}{10}R$$

$$M' = \frac{3}{20}L - \frac{3}{5}M + \frac{1}{5}R$$

$$R' = \frac{1}{20}L + \frac{7}{20}M - \frac{3}{10}R$$

$$\begin{pmatrix} L \\ M \\ R \end{pmatrix}' = \begin{pmatrix} -\frac{1}{5} & \frac{1}{4} & \frac{1}{10} \\ \frac{3}{20} & -\frac{3}{5} & \frac{1}{5} \\ \frac{1}{20} & \frac{7}{20} & -\frac{3}{10} \end{pmatrix} \begin{pmatrix} L \\ M \\ R \end{pmatrix}$$

$$\begin{pmatrix} L \\ M \\ R \end{pmatrix}' = A \begin{pmatrix} L \\ M \\ R \end{pmatrix}$$

$$\begin{aligned}\text{Characteristic Polynomial } \det(A - \lambda I) &= \lambda^3 + \frac{11}{10}\lambda^2 + \frac{99}{400}\lambda \\ &= \lambda \left(\lambda^2 + \frac{11}{10}\lambda + \frac{99}{400} \right)\end{aligned}$$

Eigenvalues:

$$\lambda = 0$$

$$\lambda = \frac{-\frac{11}{20} \pm \sqrt{\frac{121}{100} - \frac{99}{100}}}{2} = \frac{-11 \pm \sqrt{22}}{20} = \begin{cases} \frac{-11 + \sqrt{22}}{20} \approx -.315 \\ \frac{-11 - \sqrt{22}}{20} \approx -.784 \end{cases}$$

Eigenvalue	Eigenvector
$\lambda = 0$	v
$\lambda = -.315$	w
$\lambda = -.784$	u

$$\text{General Solution: } C_1 e^{0t} \mathbf{v} + C_2 e^{-.315t} \mathbf{w} + C_3 e^{-.784t} \mathbf{u}$$

General Solution: $\mathbf{X}(t) = C_1 e^{0t} \mathbf{v} + C_2 e^{-.315t} \mathbf{w} + C_2 e^{-.784t} \mathbf{u}$

$$\mathbf{X}(t) = C_1 \mathbf{v} + C_2 e^{-.315t} \mathbf{w} + C_2 e^{-.784t} \mathbf{u}$$

As $t \rightarrow \infty$, $\mathbf{X}(t) \rightarrow C_1 \mathbf{v}$

Important to find \mathbf{v}

\mathbf{v} is scalar multiple of $\begin{pmatrix} 4 \\ 2 \\ 3 \end{pmatrix}$

Entries in $\mathbf{X}(t)$ must add to 1:

$$4c + 2c + 3c = 1 \text{ implies } 9c = 1; c = 1/9$$

$$\text{Thus } \mathbf{X}(t) \rightarrow \begin{pmatrix} 4/9 \\ 2/9 \\ 3/9 \end{pmatrix}$$

Another 3 by 3 Example

$$\mathbf{X}' = A\mathbf{X} \text{ where } A = \begin{pmatrix} 4 & 4 & -11 \\ -16 & -1 & 14 \\ 9 & -6 & -6 \end{pmatrix}$$

Characteristic Polynomial is $\det(A - \lambda I)$

$$= \lambda^3 + 3\lambda^2 + 225\lambda + 675$$

$$= \lambda^3 + 225\lambda + 3\lambda^2 + 675$$

$$= \lambda(\lambda^2 + 225) + 3(\lambda^2 + 225)$$

$$= (\lambda + 3)(\lambda^2 + 225)$$

So eigenvalues are $\lambda = -3, \lambda = \pm 15i$

EIGENVECTORS: $(A - \lambda I)\mathbf{v} = \mathbf{0} = (A - \lambda I) \begin{pmatrix} v_1 \\ v_2 \\ v_3 \end{pmatrix} = \mathbf{0}$

$$A = \begin{pmatrix} 4 & 4 & -11 \\ -16 & -1 & 14 \\ 9 & -6 & -6 \end{pmatrix}$$

For $\lambda = -3$, $A - \lambda I = A + 3I = \begin{pmatrix} 7 & 4 & -11 \\ -16 & 2 & 14 \\ 9 & -6 & -3 \end{pmatrix}$

which row reduces to

$$\begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & -1 \\ 0 & -0 & 0 \end{pmatrix} \text{ so } \begin{matrix} v_1 = v_3 \\ v_2 = v_3 \\ v_3 \text{ any value} \end{matrix} \quad \text{Take } \mathbf{v} = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

Hence one solution to our system of differential equations is

$$e^{-3t} \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

EIGENVECTOR FOR $\lambda = 15i$

Here $A - \lambda I = A - 15i = \begin{pmatrix} 4 - 15i & 4 & -11 - 15i \\ -16 & -1 & 14 \\ 9 & -6 & -615i \end{pmatrix}$

which row reduces to

$$\begin{pmatrix} 1 & 0 & -i \\ 0 & 1 & 1+i \\ 0 & 0 & 0 \end{pmatrix} \text{ so } \begin{matrix} w_1 = iw_3 \\ w_2 = -(1+i)w_3 \\ w_3 \text{ any value} \end{matrix} \text{ Take } \mathbf{w} = \begin{pmatrix} i \\ -1-i \\ 1 \end{pmatrix}$$

We can write \mathbf{w} as $\begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix} + i \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix} = \mathbf{p} + i\mathbf{r}$

Solutions Associated with $\lambda = 15i$

$$\text{Eigenvector: } \mathbf{w} = \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix} + i \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix} = \mathbf{p} + i\mathbf{r}$$

$$\begin{aligned} \text{Solution: } e^{15it}(\mathbf{p} + i\mathbf{r}) &= (\cos 15t + i \sin 15t)(\mathbf{p} + i\mathbf{r}) \\ &= (\cos 15t)\mathbf{p} + i(\cos 15t)\mathbf{r} + i(\sin 15t)\mathbf{p} + i^2(\sin 15t)\mathbf{r} \\ &= [(\cos 15t)\mathbf{p} - (\sin 15t)\mathbf{r}] + i[(\cos 15t)\mathbf{r} + (\sin 15t)\mathbf{p}] \end{aligned}$$

Each term in square brackets is itself a solution.

$$\text{The first is } (\cos 15t) \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix} - (\sin 15t) \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix}$$

$$\text{which equals } \begin{pmatrix} -\sin 15t \\ \sin 15t - \cos 15t \\ \cos 15t \end{pmatrix}$$

$$\text{Similarly, the second is } \begin{pmatrix} \cos 15t \\ -\sin 15t - \cos 15t \\ \sin 15t \end{pmatrix}$$

The General Solution to $\mathbf{X}' = A\mathbf{X}$ where $A = \begin{pmatrix} 4 & 4 & -11 \\ -16 & -1 & 14 \\ 9 & -6 & -6 \end{pmatrix}$:

$$C_1 e^{-3t} \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} + C_2 \begin{pmatrix} -\sin 15t \\ \sin 15t - \cos 15t \\ \cos 15t \end{pmatrix} + C_3 \begin{pmatrix} \cos 15t \\ -\sin 15t - \cos 15t \\ \sin 15t \end{pmatrix}$$
